Adding EZPull TargetManager to Canterbury Trap Voice Release

EZPull TargetManager is a clay targets counter and control system. TargetManager can be added to trap fields equipped with Canterbury Voice Release to convert the traditional voice release system into a *"Pay and Play"* system:

- A wireless Target Sensor is patched into the cable between the power supply in the trap house and the Canterbury control box.

- The power supply box in the trap bunker is disconnected from the Trap machine and replaced by an EZPull wireless receiver.

- A TargetManager RFID card counter is installed behind the 27 yard line so it is accessible to shooters to log in their targets on the way to the Trap field.

- When the Target Sensor, connected to the Canterbury control box, senses that a target is to be released, it sends a wireless target request to the EZPull TargetManager. TargetManager checks for available targets in the "bank". If targets are available, TargetManager sends a "throw target" command to the wireless receiver connected to the Trap Machine in the Trap bunker.

EZPull Target Manager features:

- Tight target inventory control and less supervising manpower, increase gun club profitability.

- Two payment modes:
  - Pay per target, with card placed in slot.
  - Pay per round, one transaction loads 25 targets to the Target manager and card can be removed.

- Displays used targets (count up) and targets balance (count down).

- For Trap Doubles, TargetManager can be set to charge two targets for each release.

- User Programmable for all Clay Target sports: Trap Skeet, Sporting Clays, etc.

- Rugged design and waterproof enclosure for prolonged exposure to the elements.

- Integrated card holder and built-in mounting flanges.
